Wellhead Assembly Lift Tool

Introduction

Oil States' Wellhead Assembly Lift Tool (WALT) is run with an Abrasive Water Jet Internal Cutting Tool to facilitate single trip severance and recovery of a subsea multiple casing wellhead assembly.

Features

- Integrates with Oil States' Abrasive Water Jet Internal Cutting Tool
- WALT/ICT assembly is designed to run from a Marine Support Vessel, Semi-submersible or Jack-up Lift Barge
- The WALT can be deployed suspended from a vessel crane or on drill pipe
- 150MT Safe Working Load
- Can be configured to lock onto a wellhead's H4 or hub connector profile to aid breakout from the seabed and retrieval of the wellhead, casing stubs and guide base assembly.
- Can be configured to lock onto single conductors
- Diverless operation

Operation

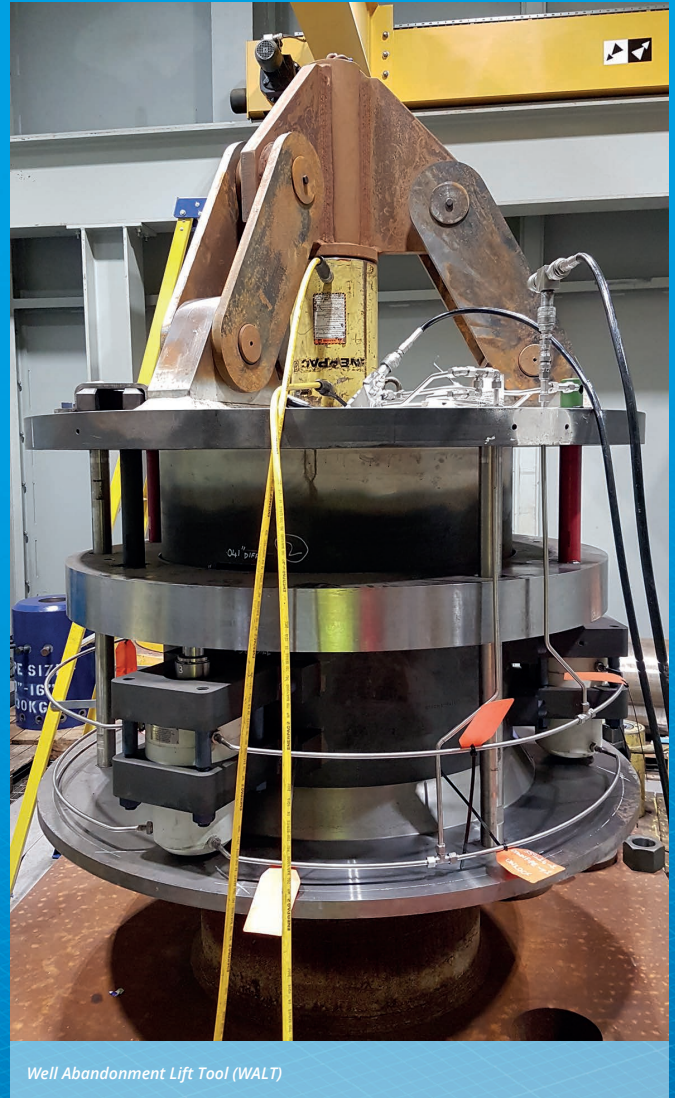

The WALT/ICT assembly is deployed subsea and run down the internal casing until the WALT lands out on the wellhead. The WALT is then locked onto the wellhead before operating the ICT to sever the multi-string casing assembly. This process allows breakout and recovery of the wellhead, casing stubs and guide base assembly from the seabed back to the surface in a safe and controlled manner.
